1 Write a testing Program for login Scenario,

```
Public class test {
@Before test
    Public void startup() {
        System.out.Println("Test Startup
                                Config");
    }
@Test
    Public void testLogin() {
        System.out.Println("Login Test
        Assert.assertTrue(true);
    }
@Test
    Public void testHomepage() {
        System.out.Println("Homepage
        String text = "Hi";
        Assert.assertEquals("Hello", text)
```

Scanned with OKEN Scanner

```
}
@ After Test
    Public void tearDown() {
        System.out.Println("Test EndConfig");
    }
}
```

2. write a cucumber Program for login scenario:

```
@ Given("user is on login Page"
    Public void openLoginPage() {
        System.out.Println("Login Page Opened");
@ When("user enters username and Password").
    Public void enter credentials() {
        System.out.Println("username Password entered
```

@Then ("User clicks login bu

Public void clickLogin() {

System.out.Println("Login button Clicked");

};

}

3. what is Page object model and explain about its advantages?

Page object model is a design Pattern used in selenium automation testing.

It creates a seperate class for each web Page of the application. web elements and actions of that Page are stored in that class.

Advantages of the Page Object model:

Easy Maintanance:

If a web element changes, we update in one Place instead of class test scripts.

Scanned with OKEN Scanner

Code reusability :

Same method can be used in many test cases.

Better Readability :

Test scripts are easy to understand.

Reduce code duplication :

Common code is w only once.
